

Session-2 : Demonstration of PaaS Application -

i) What is PaaS?

PaaS is a cloud service model that delivers a complete development and deployment environment to the cloud including infrastructure, middleware, database and deployment tools.

Benefits

- i) Faster development: no need to configure servers, built-in development tools, quick deployment.
- ii) Cost Effective: Pay-as-you-go pricing, No hardware purchase, reduced maintenance costs.
- iii) Scalability: Automatic scaling based on traffic, handles high loading easily.
- iv) Simplified development: One-click deployment, CI/CD integrations available.
- v) Better collaboration: integrated version control system.
- vi) Security & updates: reduced operational burden.

ex: Salesforce, AWS elastic beanstalk, google app engine.

Trailhead: It is an official online learning platform by Salesforce technologies through interaction models hands on exercises and real projects. Helps developers, administrators and users learn Salesforce skills.

Steps to build app using Salesforce lightning

1) Use lightning app builder

→ Drag and drop interface with features like creating pages, adding components.

2) Create lightning components

→ Developers build reusable UI elements called lightning components such as buttons, forms.

3) Connect to Salesforce data

* Setting up a Trailblazer playground.

i) Trailblazer playground is a personal Salesforce developer environment provided through Salesforce Trailhead where ~~new~~ users can practice, test and build applications safely.

- Sign up for Salesforce Trailhead and launch the playground.

* Creating Trailblazer app.

- Building basic app in Salesforce

* Creating custom objects

Eg - Student object with fields like emails, names etc

- Adding fields and data types.

Eg: Datatype for course is text and email is email.

- Designing UI through ~~low~~ No-code or low-code development methods

* Automating process in trailblazer app

What is process automation in salesforce?

- Process automation in salesforce is the use of built-in tools to automatically execute business processes based on specific triggers, conditions or event.

Flow builder : It is used to create complex workflows using a visual interface. Automates record updates, approvals.

- defining triggers add action, & configure email, save and activate.

Process Builder : another tool to automatically perform actions when ~~the~~ certain conditions are met.
Now, flow builder is encouraged compared to process builder.

* Deploying & Testing the Trailblazer app

- Developers test the app to verify that automation rules, flows & components behave as expected.
